#### Search Notes

Your queries have completed processing. You may access an electronic version via eDAN (SCORE) and /or http://es/ScoreAccessWeb.

**Protein Sequence Searches - February 2005** 

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (uniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

#### **Published Applications Database - November 2005**

Published\_Applications Nucleic Acid and Published\_Applications Amino Acid database searches now generate two sets of results each. The Published\_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published\_Applications\_New databases; older published applications make up the Published\_Applications\_Main databases.

Searches run against Nucleic Acid Published\_Applications produce two sets of results, with the extensions .rnpbm (Published\_Applications\_NA\_New).

Searches run against Amino Acid Published\_Applications produce two sets of results, with the extensions .rapbm (Published Applications AA Main) and .rapbn (Published Applications\_AA\_New).

R. Site2: DralII (CACTATO)

Rescription: lst strand cDNA was primed with an oligo(dT) primer (ATGTGGCTTTTTTTTTTTTTT) double-stranded cDNA was synthesized using specific 5 and 3' primers and amplified by PCR. The PCR product was digested with Sfit and size selection was performed to exclude fragments 41.5kb.The Sfit and size selection was performed to exclude fragments 41.5kb.The Sfit and size selection was performed to exclude fragments 41.5kb.The Sfit and size selection using selection was performed to exclude fragments 41.5kb.The Sfit and size selection using the product was digested with Sfit and size selection use cloned into distinct DralII sites of pwRalBs-Fla. XhoI sites june; used for sequencing (5 send primer [CTACTCTCTAAAGCTGCG];

... constructed by Sugano et al. (University of Tokyo, Institute of Seconstructed DralII sites can be used for sequencing (5 send primer [CTACTCTCTAAAGCTGCG];

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

or nucleic acid in biological

Claim 4; SEQ ID NO 3; 98pp; English.

The invention relates to detecting variant Cayman ataxia polypeptide or nucleic acid sequence (ATCAY) in a subject, involving providing a biological sample from a subject, where the biological sample comprises a cayman ataxia polypeptide or nucleic acid, and detecting the presence or absence of a variant Cayman ataxia polypeptide or nucleic acid in the biological sample. Also included is a kit comprising a reagent for absence of a variant Cayman ataxia nucleic acid or polypeptide in a biological sample. The human ATCAY gene (previously solated as cDNA KIAA1872, located on chromosome 19pl3.3) was identified or polypeptide in a biological sample. The human ATCAY gene (previously sen, located on mouse chromosome 10. The method is useful for detecting variant Cayman ataxia polypeptide or nucleic acid sequence in a subject. The presence of the variant Cayman ataxia, myoclonus, dystonia, epilepsy, and nystagmus in the subject. The biological sample; and an amiotic fluid sample, a tissue sample, urine sample, saliva sample; and an adult animal. The animal is a human. The human is an adult female of child-bearing age. The presence is the monding the contain the allele encoding the normal propertion or propertion or propertion. normal, non-disease causing protein.

The invention relates to detecting variant Cayman ataxia polypeptide or nucleic acid sequence (ATCAY) in a subject, involving providing a biological sample from a subject, where the biological sample comprises a CC dayman ataxia polypeptide or nucleic acid in the presence of a variant Cayman ataxia polypeptide or nucleic acid in the cC dayman ataxia polypeptide or nucleic acid in the biological sample. Also included is a kit comprising a reagent for detecting the presence or absence of a variant Cayman ataxia nucleic acid or polypeptide in a biological sample. The human ATCAY gene (previously isolated as CDNA KIAA1872; located on chromosome 19p13.3) was identified or polypeptide in a biological sample. The human ATCAY gene (previously cor polypeptide on mouse chromosome 10. The method is useful for detecting variant Cayman ataxia polypeptide or nucleic acid sequence in a subject. The presence of the variant Cayman ataxia polypeptide or nucleic acid is indicative of a disorder chosen from ataxia, mycolonnia, cepilepsy, and nystagmus in the subject. The biological sample is chosen from allock sample, The subject is chosen from embryo, foetus, newborn amilotic fluid sample. The subject is chosen from embryo, foetus, newborn

Claim 1; SEQ ID NO 2457; 5504pp; English.

```
The present invention describes an isolated tumour-associated antigenic target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide concerneds (see SEQ ID Noi. to 4622); (b) the full-length coding region of (a); (c) the complement of (a) or (b); (d) a sequence that has 80; sequence identity to (a)-(c); or (e) a sequence that hybridises to (a)-(c). Also described; (1) an expression vector comprising the above corporation to (a) a not concerned by any of the above comprising; (a) a host cell comprising the above expression vector; (3) a process for producing a polypeptide; (4) an isolated polypeptide comprising; (b) an amino acid sequence encoded by the full-comprising; (b) an amino acid sequences; or (c) a sequence of nucleotide sequences; (b) an amino acid sequences; or (c) a sequence comprising the above polypeptide full-length coding region of the above nucleotide sequences; or (c) a sequence comprising the above polypeptide full to (a) or (b); (5) a chimeric polypeptide; (6) an isolated antibody that binds to the above polypeptide; (7) a process or producing the above polypeptide; (8) an isolated antigenic target (TAT) binding organic molecule that binds to the above polypeptide; (10) a composition of matter contrained within the container and container and the container; (11) an article of manufacture comprising a container and the container; (12) methods of this above polyperide or TAT binding organic container and the container and the container.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the composition of matter contained within the containing the growth of a cell that expresses the above protein, where the growth of the cell is at least in part dependent upon a growth of presence of the above protein; (13) a method of protein defect of the above protein; (13) a method of protein of the apove protein; (14) a method of determining the presence of a protein in a sample suspected of containing the protein of a protein in a sample suspected of containing the protein described above; (15) methods of diagnosing the presence of a tumour in mammal; (16) a method for treating or preventing a cell proliferative disorder associated with increased expression or activity of the above protein; and (17) a method of binding an antibody, oligopetide or organic molecule to a cell that expresses the protein described above. The TAT sequences have cytostatic activities, and can be used in gene therapy. The composition and methods are useful for diagnosing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nnting or treating cancer. The composition is also used for preparin licament for the therapeutic treatment or diagnostic detection of a proliferative disorder or cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       99.9%; Score 2913.8; DB 12; Length 4978; 99.9%; Pred. The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are oversyptessed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide esequences at least 80% identical to the TAT nucleic acids and polypeptides esequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptides, nucleic acids, and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with cancer, lung cancer, calcularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, carvical cancer, carvical cancer, orlorectal cancer, lung cancer, cervical cancer, pancreatic cancer, cervical cancer, pancreatic cancer, cervical cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

Polypeptides and polymuclectides of the invention may be used in the investigation of differential expression of the DNA sequences in normal subjects and disease patients. They may also be used in the production of antibodies, oligonuclectide probes and DNA chips for diagnosis and identification of drugs for treatment of diseases with which the DNA sequences are associated. The sequences given in records ABN83954-ABN83984 represent human gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genes and their expression products cloned from human cDNA libraries for treatment and diagnosis of diseases associated with their expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the CDNA encoding the human NIP2b protein, a member of the NIP2 protein family. It is predominantly expressed in the brain and also in prostate and small intestine. It plays a major role in apoptosis. The NIP2b nucleotide sequence is 74% identical to human mRNA for KIAA0367. NIP2b interacts with proteins like adenoviral BiB 19 kDa protein or BCL-2 protein to provide a cell survival function. It activates NIP2b-dependent signal transduction pathway and modulates programmed cell death. This sequence can be used to screen for NIP2b, NIP2c, and NIP2cS sequences and mutations in them, in diagnostic and prognostic assays, pharmacogenetics and for therapeutic and prophylactic purposes. It can also be used to screen for naturally occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          143

complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence, where the combination of the 5'-end sequence 2'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in specification. The primers are useful for synthesising polynucleotides, gene therapy. The primers are useful for synthesising polynucleotides, the full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and seally without any specialised methods. AMH0363 to AMH18628 and AMH18633 to AMH1862 represent human amino acid sequences; and AMH18629 to AMH1862 represent invarient invarient the semplification of the present invarient invarient the semplification of the present invarient invarient.

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel

CC polypeptides. Also claimed is a polypeptide encoded by the polymuclectide

or its partial peptide, an antibody binding to the polypeptide or peptide

of the polymuclectide, immunologically assaying the polypeptide or peptide

CC of the polymuclectide by contacting the polypeptide or peptide

CC with the antibody of the encoded protein, and observing the binding

CC with the antibody of the encoded protein, and observing the binding

CC with the antibody of the encoded protein, and observing the binding

CC with the antibody of the encoded protein, and observing the binding

CC contacting the polymuclectide. The polymuclectide in an expressible manner and an antisense polymuclectide. The oligomuclectide

CC detecting the polymuclectide. The polymuclectide, or as a probe

CC of detecting the polymuclectide. The polymuclectide and encoded

CC for detecting the polymuclectide. The polymuclectide and encoded

CC of genes may be included in them, for developing a diagnostic marker or

CC genes may be included in them, for developing a diagnostic marker or

CC gene may be included in them, for developing a diagnostic marker or

CC gene therapy. The genes are involved in tissue and/or cell

CC gene therapy. The genes are involved in tissue and/or cell

CC regeneration. Wembrane proteins, signal transduction-related proteins,

CC respectivity or expression of the encoded protein to treat diseases. The

CC neurological diseases, cancer, tumours. The cDNA may be used to regulate

CC the activity or expression of the envention. Note: Some of the sequence

CC data for this patent is not represented in the printed specification, but

                                                                                                                                                                                                                                                                                               dementia and various cancers,
                                                                                                                                                                                                                                                                                                                                                The invention relates to 2495 novel polynucleotides (I) and their encode polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a nucleotide sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGTAAGGAGAGAGCTGTCTCAGCTGCAGAGGGGTCATCCCTGCTTCAAGCCCGTGCCT

```
The invention relates to detecting variant Cayman ataxia polypeptide or nucleic acid sequence (ATCAY) in a subject, involving providing a biological sample from a subject, where the biological sample comprises a Cayman ataxia polypeptide or nucleic acid, and detecting the presence or absence of a variant Cayman ataxia polypeptide or nucleic acid in the biological sample. Also included is a kit comprising a reagent for chicogracial sample and part of a presence or absence or absence of a variant Cayman ataxia nucleic acid or polypeptide in a biological sample. The human ATCAY gene (previously isolated as cDNA KIAABT2, located on chromosome 19p1) 3) was identified and mapped using the fact that it is the homologue of the mouse jittery gene, located on mouse chromosome 10. The method is useful for detecting variant cayman ataxia polypeptide or nucleic acid sequence in a subject. The presence of the variant Cayman ataxia polypeptide or nucleic acid sample. The presence of the variant Cayman ataxia, myoclonus, dystonia, complete acid sample, a tissue sample, urine sample, saliva sample, and an amincit from blood sample, and an adult animal. The submit is a human. The animal is a human. The human is an adult female of child-baring age. The present sequence is the DNA representing a Human ATCAY splice site of exon 9-introm of canner a read through mirtain represent to be produced.
                                                                                                                                                                            Human; jittery; ds; Cayman ataxia; ATCAY; KIAA1872; chromosome 19p13.3; ataxia; myoclonus; dystonia; epilepsy; nystagmus; splice site mutant; SNP; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting variant Cayman ataxia polypeptide or nucleic acid sequence in subject, by detecting presence or absence of variant Cayman ataxia polypeptide or nucleic acid in biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 47219 BP; 11562 A; 12203 C; 12045 G; 11209 T; 0 U; 200 Other;

The invention relates to detecting variant Cayman ataxia polypeptide or nucleic acid sequence (ATCAY) in a subject, involving providing a biological sample from a subject, where the biological sample comprises a cayman ataxia polypeptide or nucleic acid, and detecting the presence or absence of a variant Cayman ataxia polypeptide or nucleic acid in the biological sample. Also included is a kit comprising a reagent for detecting the presence or absence of a variant Cayman ataxia nucleic acid or polypeptide in a biological sample. The human ATCAY gene (previously isolated as CDNA KIAA172, located on chromosome 19p13.3) was identified and mapped using the fact that it is the homologue of the mouse Jittery gene, located on mouse chromosome 10. The method is useful for detecting variant Cayman ataxia polypeptide or nucleic acid sequence in a subject. The presence of the variant Cayman ataxia polypeptide or nucleic acid is indicative of a disorder chosen from ataxia, myoclonus, dystonia, epilepsy, and nystaguus in the subject. The biological sample is chosen from blood sample, a tissue sample, urine sample, saliva sample, and an aminatic fluid sample. The subject is chosen from enbryo, foetus, newborn animal; and an adult feman adult animal. The animal is a human. The human genomic DNA for ATCAY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           56444

The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel

CC from 1970 fully defined nucleotide sequences which encode novel

CC polypoptides. Also claimed is a polypoptide encoded by the polymucleotide or peptide or its partial peptide, immunologically assaying the polypoptide or peptide or the polymucleotide. Immunologically assaying the polypoptide or peptide of the polymucleotide by contacting the polymucleotide or peptide or the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide. The oligonucleotide is useful as a primer for synthesising the polymucleotide and encoded for detecting the polymucleotide. The polymucleotide and encoded contacting the polymucleotide and many disease-related contacting the polymucleotide. The polymucleotide and encoded contacting the polymucleotide in the many be included in their expression and activity, or as targets of genes may be included in their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins are coding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding them can be used as indicactors for diseases (e.g. osteoporosis, encoding the printed specification, but the printed specification, but the printed specification, but the sequence presented is a cDN

The invention relates to detecting variant Cayman ataxia polypeptide or nucleic acid sequence (ATCAY) in a subject, involving providing a biological sample from a subject, where the biological sample comprises a CC Cayman ataxia polypeptide or nucleic acid, and detecting the presence or absence of a variant Cayman ataxia polypeptide or nucleic acid in the cological sample. Also included is a kit comprising a reagent for detecting the presence or absence of a variant Cayman ataxia nucleic acid or polypeptide in a biological sample. The human ATCAY gene (previously isolated as cDNA KIAA1872, located on chromosome 19p13.3) was identified or mousped using the fact that it is the homologue of the mouse Jittery gene, located on mouse chromosome 10. The method is useful for detecting variant Cayman ataxia polypeptide or nucleic acid sequence in a subject. CC The presence of the variant Cayman ataxia polypeptide or nucleic acid sequence in a disorder chosen from ataxia, mycolonus, dystonia, cpilepsy, and nystagmus in the subject. The biological sample, and an acid is from blood sample, a tissue sample, urine sample, saliva sample, and an andult female of child-bearing age. The present sequence is the coby animal, young animal, and an adult animal. The animal is a human. The human is an adult female of child-bearing age. The present sequence is Sequence 2166 BP; 523 A; 619 C; 576 G; 448 T; 0 U; 0 Other; us-10-699-941-3.rng

The present invention describes primer sets for synthesising 5602 fulllength cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprising a sequence complementary to the comprise and an oligonucleotide comprising a sequence complementary to a sequence and an oligonucleotide comprises a 3'-end sequence complementary to a coligonucleotide which comprises a 3'-end sequence of polynucleotide which comprises a 1'-end sequence, where the coligonucleotide comprises a 1'-end sequence of in the comprise of the polynucleotide and the combination of the 5'-end sequence 1'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in specification. The primer sets can be used in seful for the perturbance of the full-length cDNAs. The primers are also useful for the comprise and of actionable of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are primers and MAH13629 to AAH13628 and AAH13633 to AAH13632 represent human amino acid sequences; and ANH3629 to AAH13622 represent invention of the present invention of the present invention of the present invention allost which are used in the exemplification of the present invention and perturbance and and an are used in the exemplification of the present invention. New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 1; SEQ ID NO 16127; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed confin diagnostics as expressed sequence tags for identifying expressed confin diagnostics of the creation of the confine co

Sequence 4, Application US/09174937

Batent No. 6756212

GENERAL INFORMATION:

APPLICANT: Khodadoust, Mehran

TITLE OF INVENTION: Isolated Proteins and Nucleic Acid Molecules Having

TITLE OF INVENTION: Homology to NIP2 Proteins and Uses Thereof

FILE REPERRUCE: maio61

CURRENT APPLICATION NUMBER: US/09/174,937

NUMBER OF SEQ ID NOS: 9

SOFTWARE: Patentin Ver. 2.0

Sequence 15793, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR PLILNG DATE: 2000-10-20
